Executive Summary

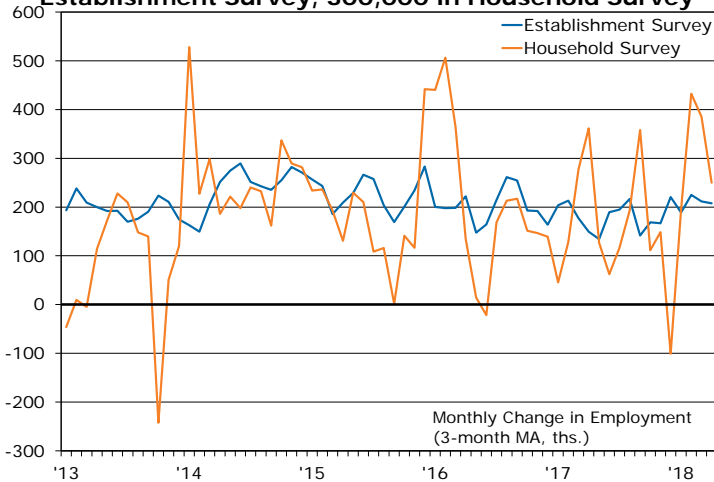

Slower but Still Solid Economic Growth in the First Quarter; Lowest Unemployment Rate in 17 Years

- The U.S. economy expanded 2.3 percent at a seasonally-adjusted annualized rate in the first quarter of 2018. This was softer than the average 3 percent growth over the previous three quarters, but real GDP was up 2.9 percent from one year earlier in the first quarter, the biggest year-over-year gain since the second quarter of 2015. The details were a bit weaker than the headline number. Inventories added 0.4 percentage point to growth, after being a big drag in the fourth quarter of 2017. Thus final sales of domestic product, which is GDP minus the change in inventories and measures domestic and foreign demand for goods and services produced in the United States, increased 1.9 percent at an annual rate in the first quarter.
- The U.S. added 164,000 jobs in April, with gains of 168,000 in the private sector and losses of 4,000 in government. There was a combined upward revision to job growth in February and March of 30,000. The U.S. economy has added an average of 200,000 jobs per month so far in 2018, above last year's pace of 182,000. The unemployment rate fell 0.2 percentage point in April to 3.9 percent, down from 4.1 percent in the six previous months. This is the lowest unemployment rate since December 2000. However, the unemployment rate fell because the labor force (the number of people either working or looking for work) fell by 239,000 in April. The number of jobs in the household employment survey (different from the survey of employers) rose by just 3,000 in April. Still, job growth in the household survey has averaged close to 300,000 so far in 2018. The broader U-6 unemployment rate (unemployed, underemployed and too discouraged to look for a job) fell to 7.8 percent from 8.0 percent in March, its lowest since mid-2001. Average hourly earnings in April were up 2.6 percent from one year earlier, unchanged from the March pace.
- Productivity in the nonfarm business sector rose 0.7 percent at an annual rate in the first quarter. This was an acceleration from the 0.3 percent increase in the fourth quarter of last year, but below the 1.3 percent pace for all of 2017. After solid gains in the middle of last year, productivity growth slowed in late 2017 and early 2018. Productivity growth has been disappointing throughout the current economic expansion, and absent an acceleration in productivity growth, economic growth in the United States is likely to remain well below its long-run average.

Monthly Job Growth So Far This Year of 200,000 in Establishment Survey, 300,000 in Household Survey

Unemployment Rate at Its Lowest Since Late 2000

Trade Tensions Are Fading, But New Deals Won't Change the Outlook

After proposing steep tariffs on many imported goods, the Trump administration appears to be backing down. The administration is working toward an agreement under which China would increase imports from the U.S., and negotiations continue with Canada and Mexico on changes to NAFTA. Any changes are likely to be superficial and do little to boost U.S. economic growth. Over the long run larger federal government budget deficits are likely to lead to larger trade deficits.

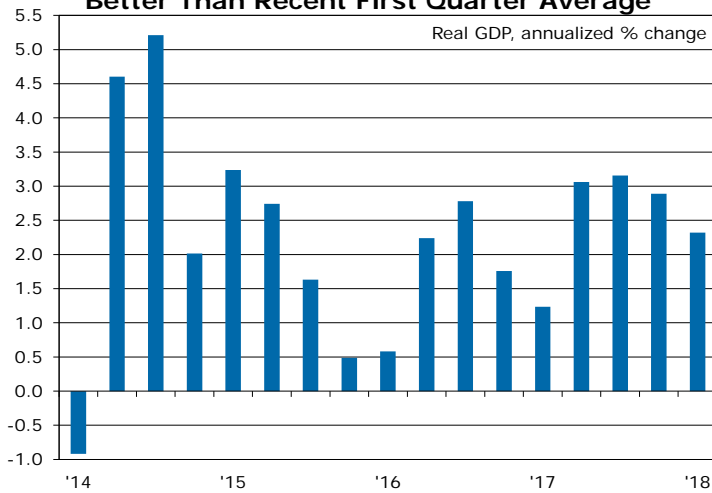

President Trump campaigned in 2016 on a platform of raising trade barriers, arguing that other nations were taking advantage of the United States, harming the economy. This was a noticeable break from the bipartisan consensus since World War II, which generally viewed trade as a win-win outcome and favored reduced trade barriers. The administration's trade rhetoric heated up this year, with the president proposing a 25 percent tariff on imported steel and a 10 percent tariff on imported aluminum. This was ostensibly on national security grounds, but the president emphasized the supposed benefits for U.S. workers in promoting the tariffs. The president also proposed a 25 percent tariff on many categories of goods imported from China, leading China to propose its own tariffs on politically-sensitive goods from the U.S., such as soybeans. The Trump administration recently barred U.S. firms from selling to Chinese tech company ZTE to punish it for violating sanctions on Iran and North Korea. And the administration is currently renegotiating NAFTA with Canada and Mexico.

The administration has backed off on some of these initial proposals, however. The steel and aluminum tariffs have not yet been implemented, in part because of opposition from industries that use imported steel and aluminum. The administration has temporarily exempted some major security partners, and is negotiating permanent exemptions with them. The administration is also negotiating with China over ZTE and tariffs; there have been initial reports of a deal that would lead China to reduce its trade surplus with the U.S. by substantially increasing its purchases of U.S. goods, including agricultural products and aircraft. The NAFTA negotiations continue despite having run past a deadline set by Speaker of the House Ryan. The most likely outcome of all of these efforts is cosmetic changes that would allow the Trump administration and our trading partners to both claim victories but result in minimal changes to the current trade regime and have no discernable impact on the U.S. economic outlook. However, there is downside risk to the U.S. outlook from back-and-forth trade restrictions that would raise costs for U.S. business and consumers and weigh on global growth and U.S. exports.

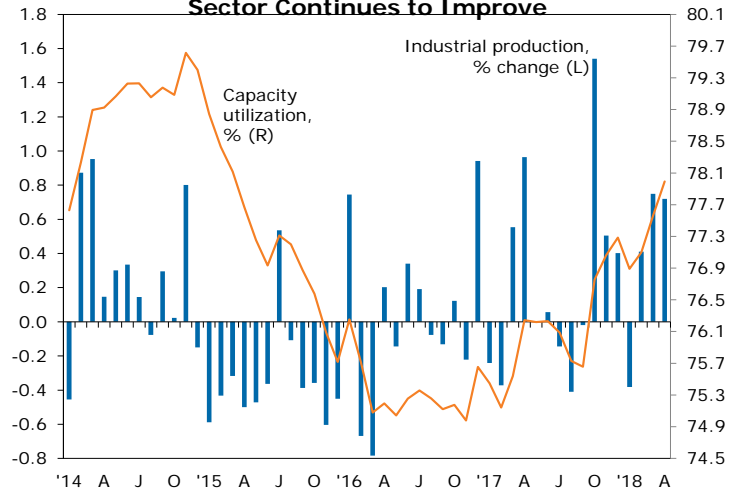

Over the long run the Trump administration's efforts could do some damage to the U.S. economy. The administration appears focused on bilateral trade deficits and deals. This makes it more difficult for the U.S. to help set the "rules of the road" that will govern global trade over the long run; an example of this is the U.S. decision to drop out of negotiations over the Trans-Pacific Partnership. This approach also largely ignores less obvious but more arguably important issues, such as protection of intellectual property, which is a serious concern for innovative U.S. firms. In addition, federal budget policy will lead to larger U.S. trade deficits over the long run. It is an accounting identity that the trade deficit (technically the current account deficit) is equal to total saving minus domestically-financed investment. Thus greater federal government borrowing, because of deficit-financed tax cuts and spending increases, will lead to reduced U.S. saving and larger U.S. trade deficits.

Although trade will be a drag, real U.S. GDP growth will accelerate to above 3 percent on a year-over-year basis by late 2018. Business investment and consumer spending will both get boosts from the tax cuts, and the housing market will continue to improve despite higher mortgage rates. A large increase in federal government spending will also be a near-term positive. Growth will then slow in 2019 as fiscal stimulus wears off. Job growth this year will maintain its 2018 pace of around 180,000 per month, and the unemployment rate will move lower, to around 3.5 percent by the end of the year. The tighter job market will lead to faster wage growth, providing additional support to consumer spending and offsetting the drag from higher energy prices.

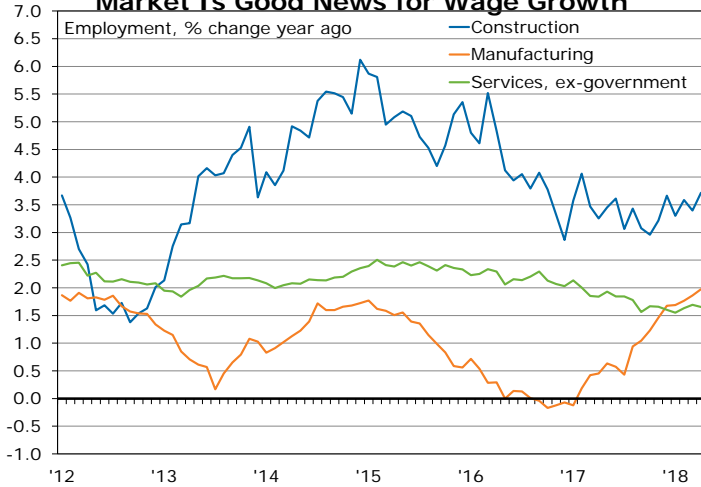

Slower Growth at Beginning of 2018, But Still Better Than Recent First Quarter Average

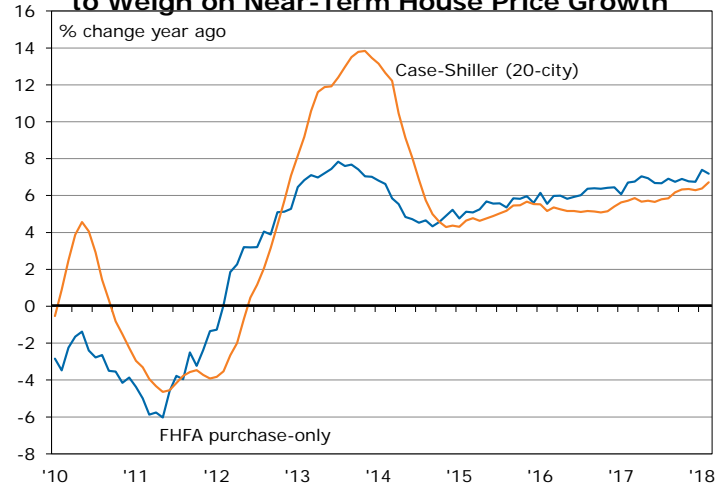

With Stronger Demand, Industrial Sector Continues to Improve

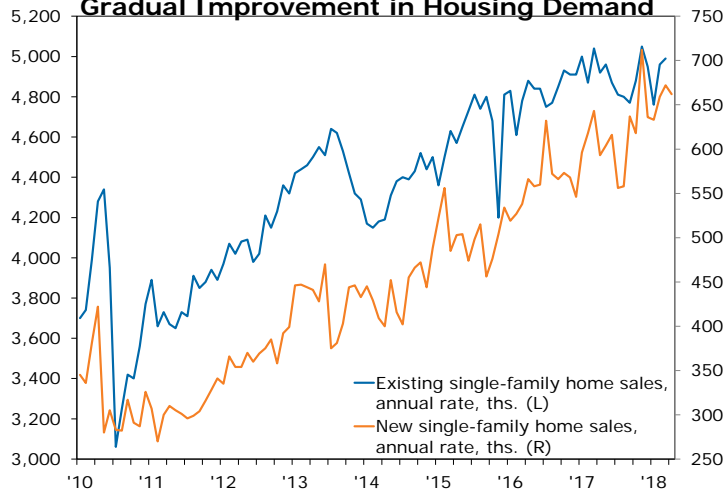

Broad-Based Improvement in Labor Market Is Good News for Wage Growth

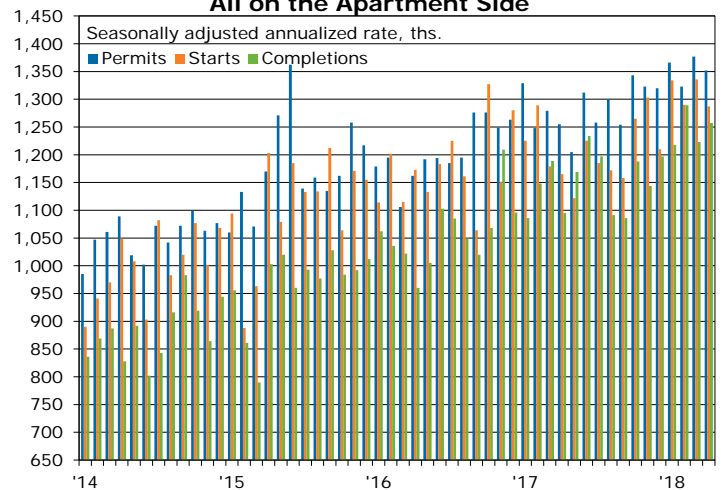

Higher Mortgage Rates, Tax Law Changes Set to Weigh on Near-Term House Price Growth

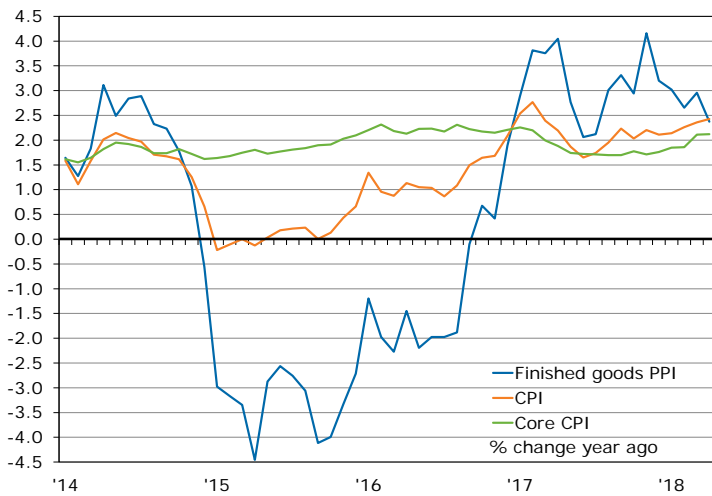

Despite Higher Mortgage Rates, Continued Gradual Improvement in Housing Demand

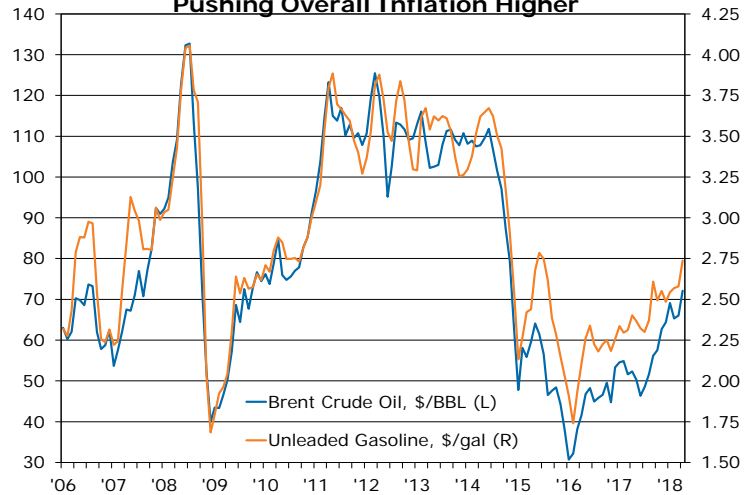

Weakness in April Housing Starts All on the Apartment Side

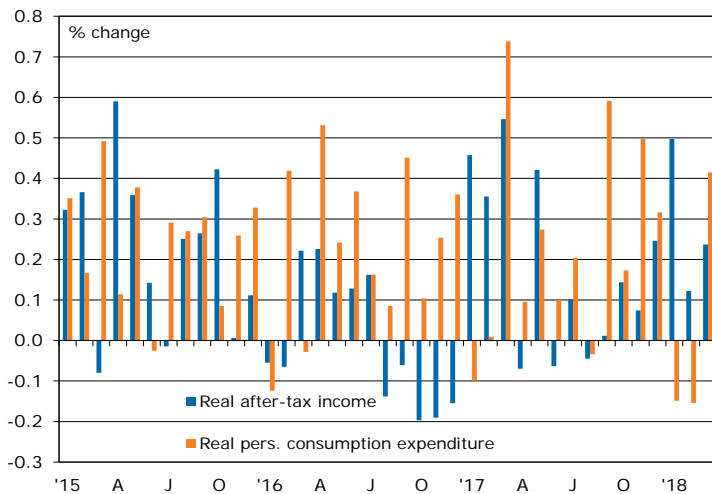

Fed Has Welcomed Gradual Acceleration in Inflation

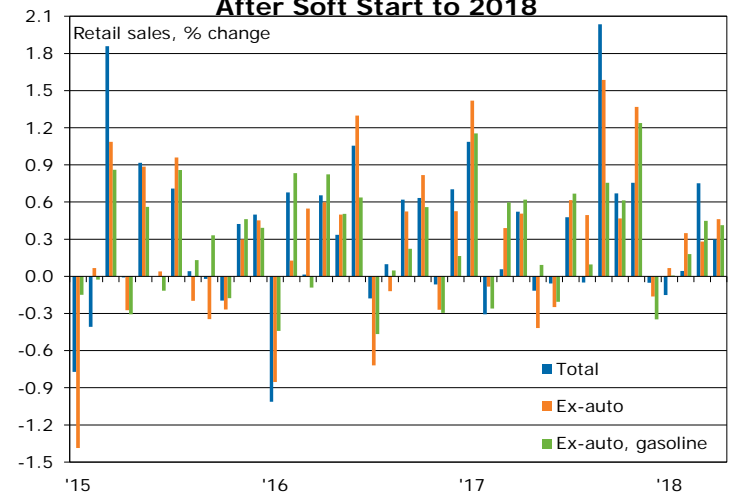

Big Jump in Oil Prices Is Pushing Overall Inflation Higher

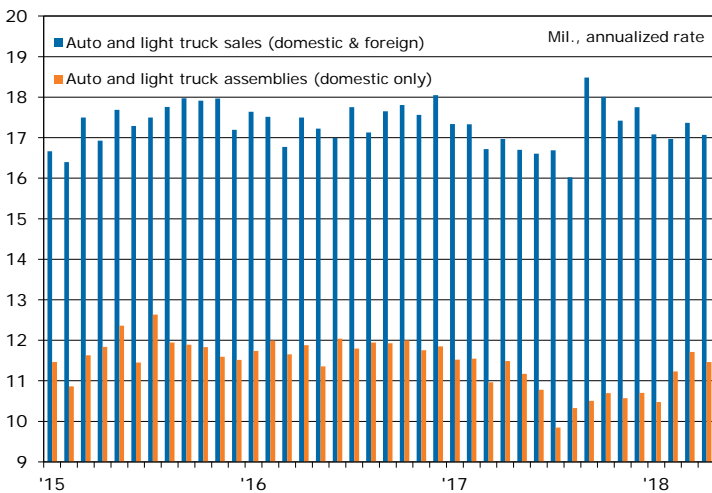

Better Consumer Spending Numbers in March

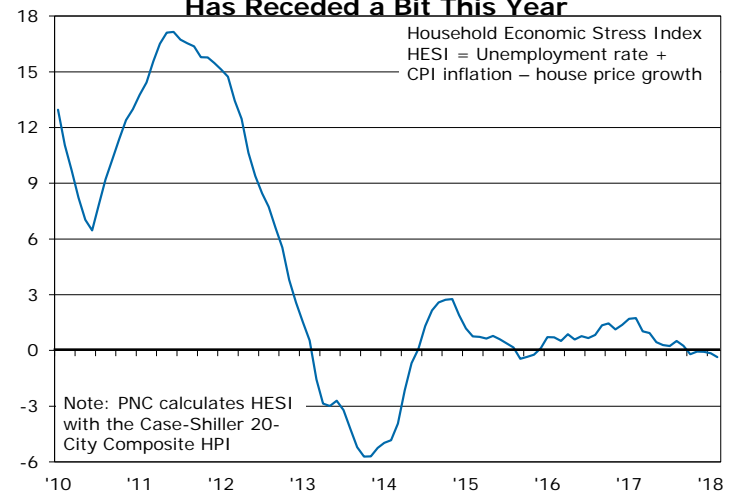

Better Retail Sales Numbers After Soft Start to 2018

Vehicle Production Has Picked Up in 2018

Household Economic Stress Has Receded a Bit This Year
